

# A Decade of Improvements in Data Systems and Data Sharing

S Pouliquen, S Hankin, B Keeley, J Blower,  
C Donlon, A Kozyr, R Guralnick

OceanObs09  
Venice 21 September 2009

# The ways of Using Data have changed

Ocean information for society:  
sustaining the benefits,  
realizing the potential  
21-25 September 2009, Venice, Italy

OceanObs'09

- A lot of **data are collected but not easily accessible** while they could serve multiple applications
- The **nature of science has changed** : more work on context, impact synthesis rather than well individual process studies . Need for other scientists data
- **Government agencies requirements have changed**
  - ⇒ **Global scale applications** requiring integrated observing system (climate change, ocean health monitoring, fisheries assessment,...)
  - ⇒ **No country can pay the full bill** for the data acquisition
  - ⇒ A new paradigm emerging : "**Data acquired with public funds should be publically available**"
- **Important demand for real time data access** especially in operational oceanography and monitoring applications
- **Information Technology and Data Management techniques are no more an obstacle to information sharing**

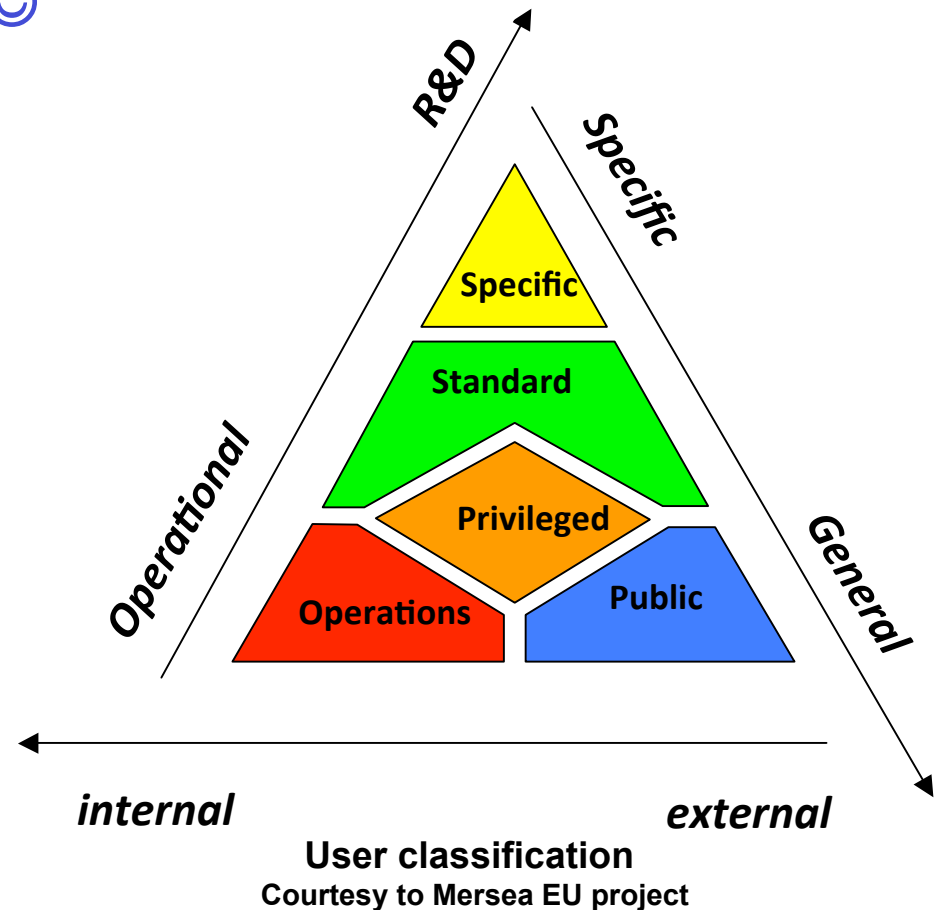

# Ingredients for smooth Data sharing

⇒ Find the compromise between user needs and providers capabilities ☺

⇒ Categories of users from operational to research

⇒ Categories of services from routine & robust to specific and tailored

⇒ Categories of providers : operational agencies, research community, private sector

Providers used to tailor their service for their direct users .

BUT Serving other users need more work and harmonization with others

# Distance between an observing system and a User

Time	From	To	Who	What
???	Platform	Media	<b>Provider:</b> can be a scientist, an agency, a private company,...	<ul style="list-style-type: none"> <li><b>Collects</b> data , transform sensor measurements into oceanographic information.</li> <li>Records/<b>Describes</b> the way the data has been collected</li> </ul>
60's	Media	Repository	<b>A Data Center</b>	<ul style="list-style-type: none"> <li><b>Archives, quality control, distributes</b> the data to the external users</li> <li>Ensures that required <b>metadata</b>, have been filled in and <b>traces</b> the history of the processing of the data ( version tracking)</li> </ul>
90's	Repository	Service provider	<b>Thematic Assembly Center</b>	<ul style="list-style-type: none"> <li><b>Integrates</b> various data into a coherent product, <b>checks the coherency</b> of the data coming from various platforms, provide feedback to Data centers when anomalies are detected.</li> <li><b>Derives value added products</b> designed for a kind of application</li> <li><b>Ensures distribution to a wider community</b></li> </ul>

# SOME SUCCESS STORIES

A Decade of improvements in Data Systems and Data Sharing

# In-Situ Physical Oceanography : Argo

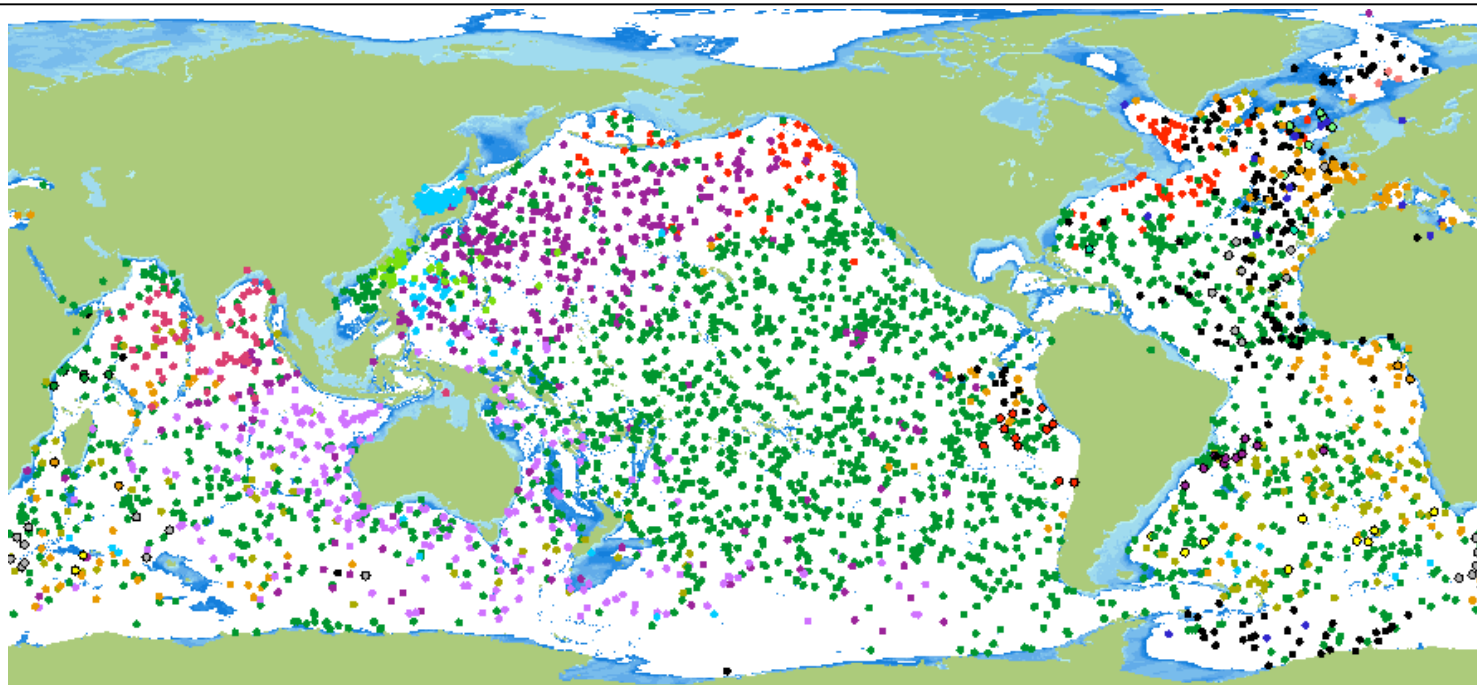

OceanObs'09  
Ocean information for society:  
sustaining the benefits,  
realizing the potential  
21-25 September 2009, Venice, Italy

- Open data policy
- Multi stage data processing
- Centralized data holding
- Common Format
- Common Quality control procedures in Real-Time and Delayed mode

Ocean information for society:  
sustaining the benefits,  
realizing the potential  
21-25 September 2009, Venice, Italy

OceanObs'09

- 90% of the data are processed within 24h and available freely
- More than 320 000 profiles at GDACs. 9 000 new profiles per month
- 10 National Data Centers, 2 Gdacs, 12 Delayed mode operators, 5 Regional centers

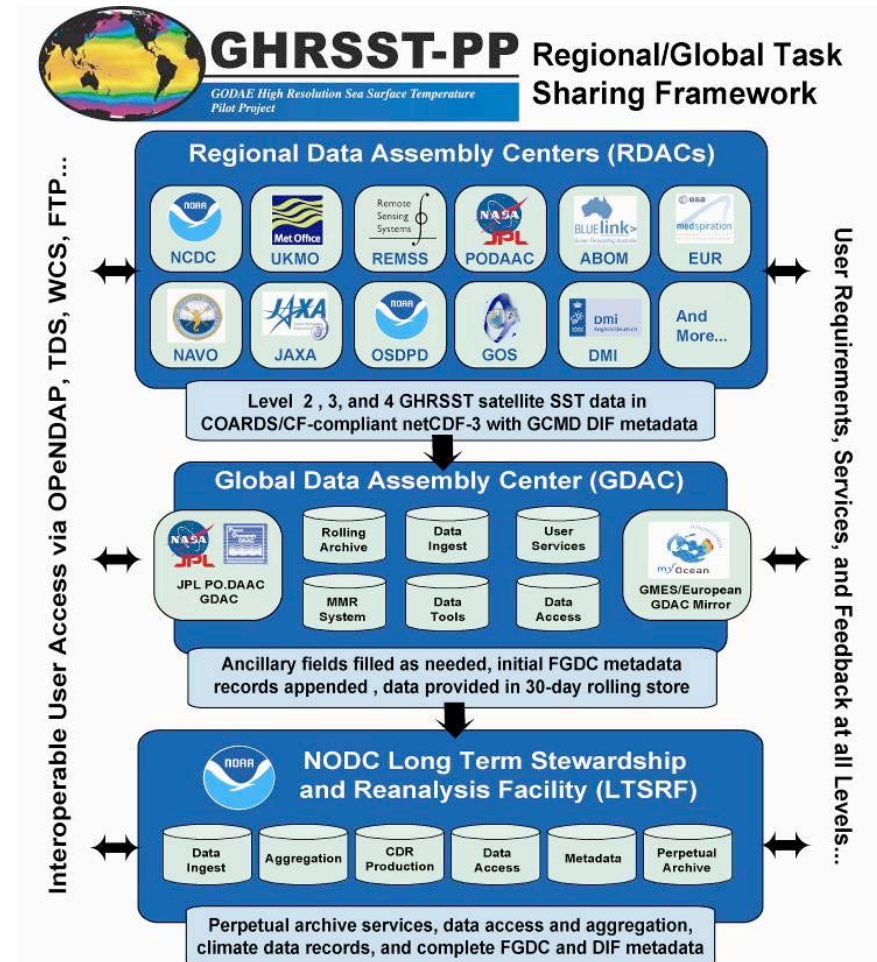

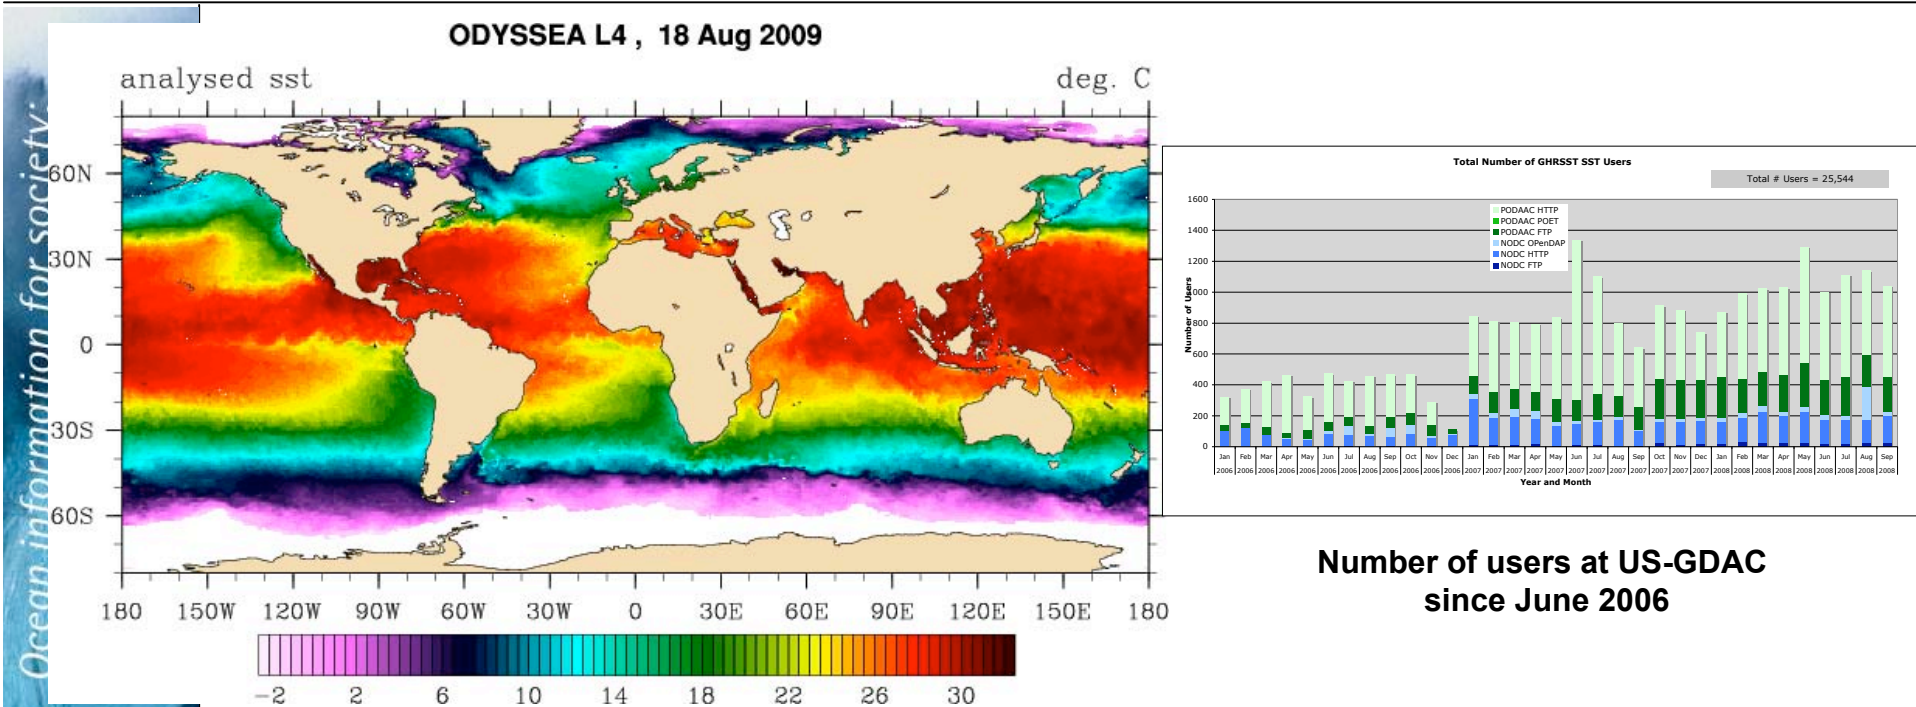

# Satellite Observations: GHR SST

OceanObs'09 Ocean information for society:  
 sustaining the benefits,  
 realizing the potential  
 21-25 September 2009, Venice, Italy

- Open data policy
- Decentralized data processing , centralized distribution at GDACs
- Common format data provided with uncertainty estimates and ancillary parameters
- Value added products generated at Regional Data Centers

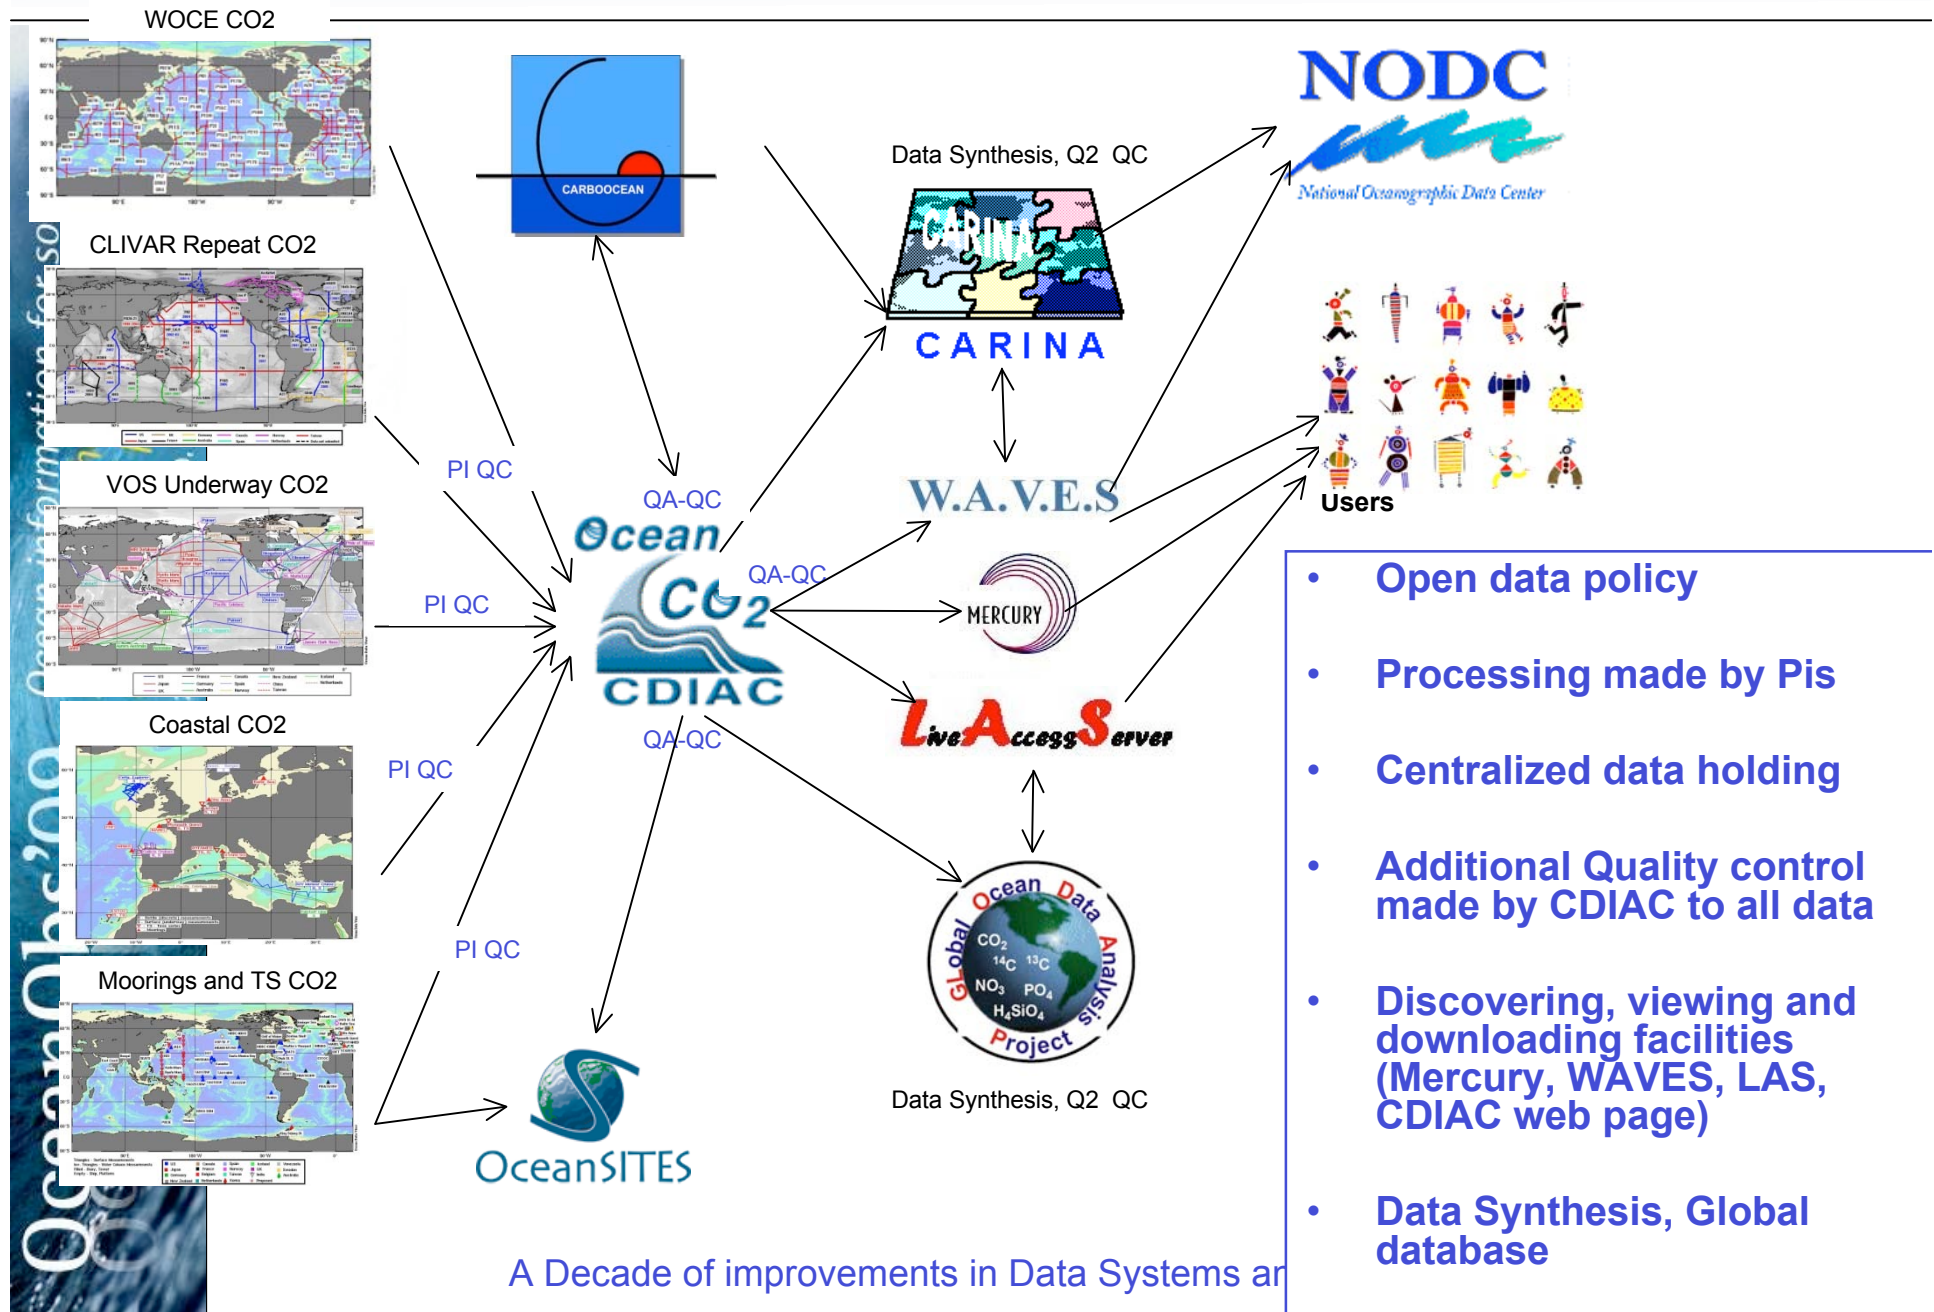

**Number of users at US-GDAC  
since June 2006**

- Total archive exceed 20TB from 1981 to present
- About 200 users downloading the data from GDAC every month, 1000 on the WWW
- 2 GDACS, 11 RDACs, 1 Long term repository and reanalysis facility.

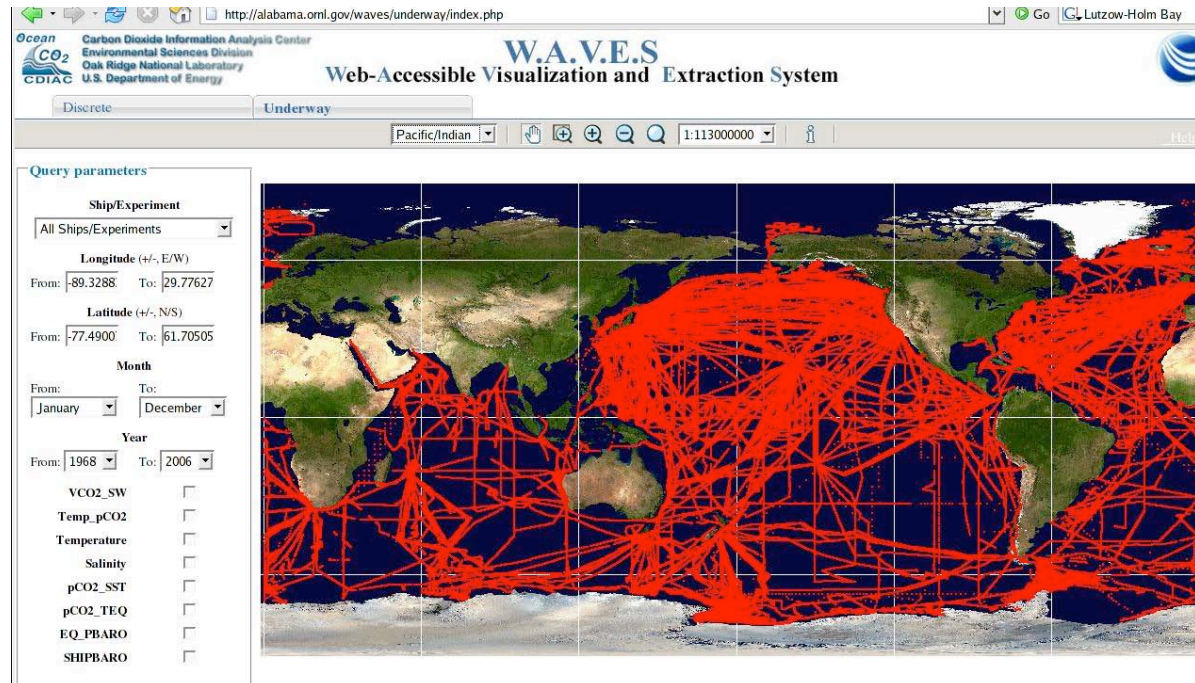

# In-Situ Carbon Data : CDIAC

# In-Situ Carbon Data : CDIAC

## Web interface to surface measurements

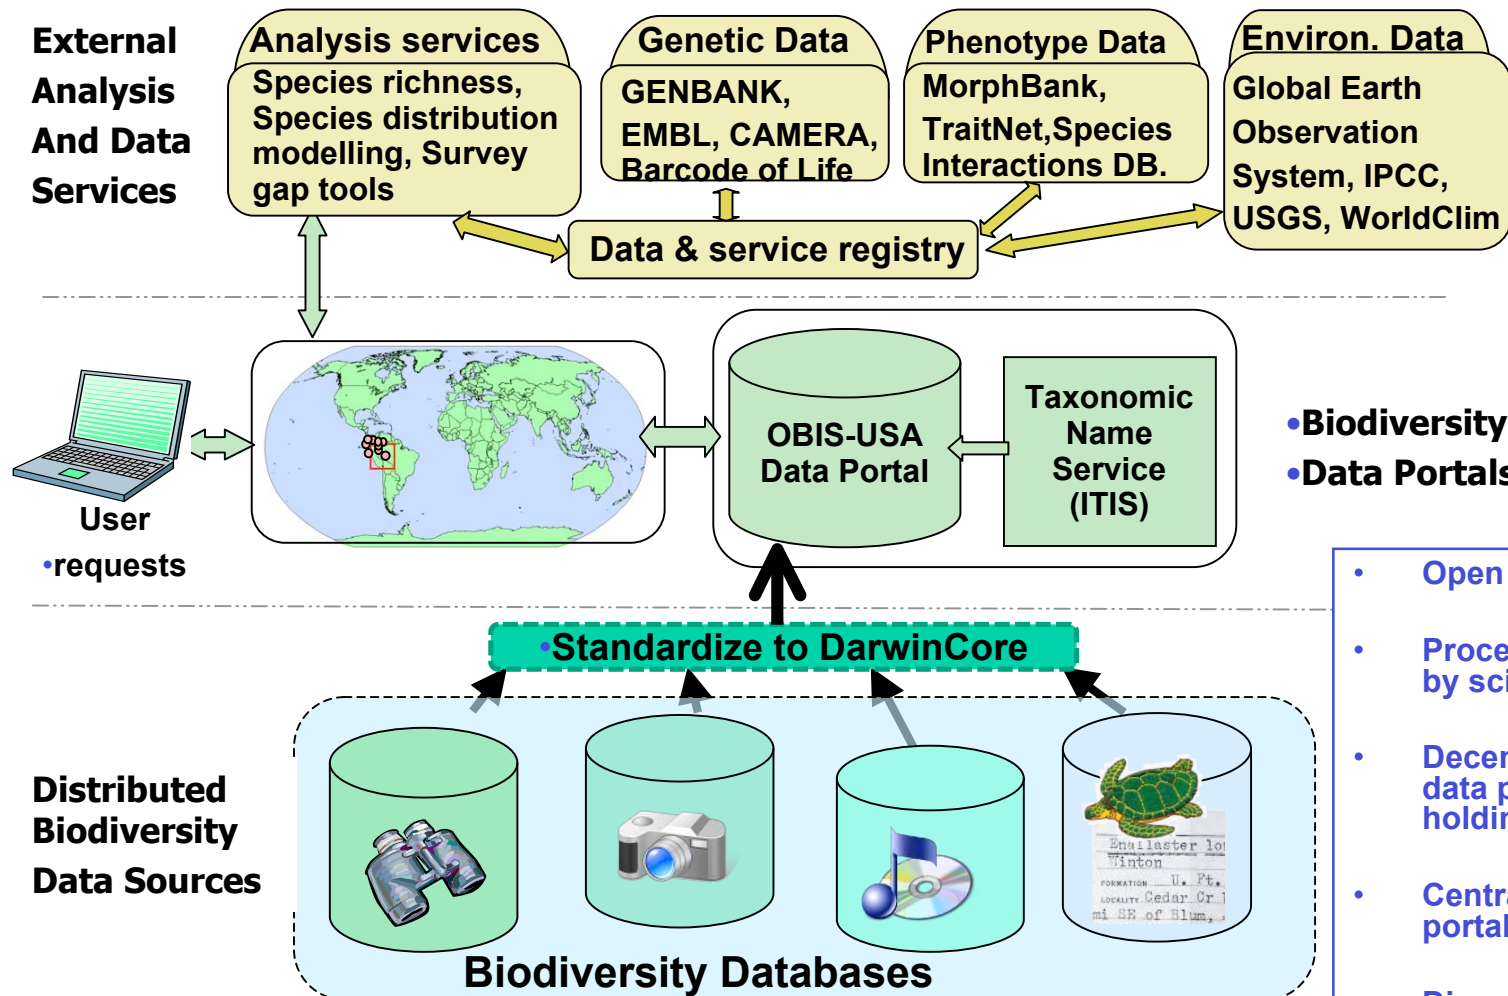

- LDEO Database V2007 consist 4.5 million surface measurements of CO<sub>2</sub>
- Covered from 1960s to present time
- The CARBOOCEAN SOCAT database will be open through CDIAC in 2010 with 7.5 million surface measurements of CO<sub>2</sub>

A Decade of improvements in Data Systems and Data Sharing

# Biological In-situ Observations : IOBIS

- **Biodiversity**
- **Data Portals**

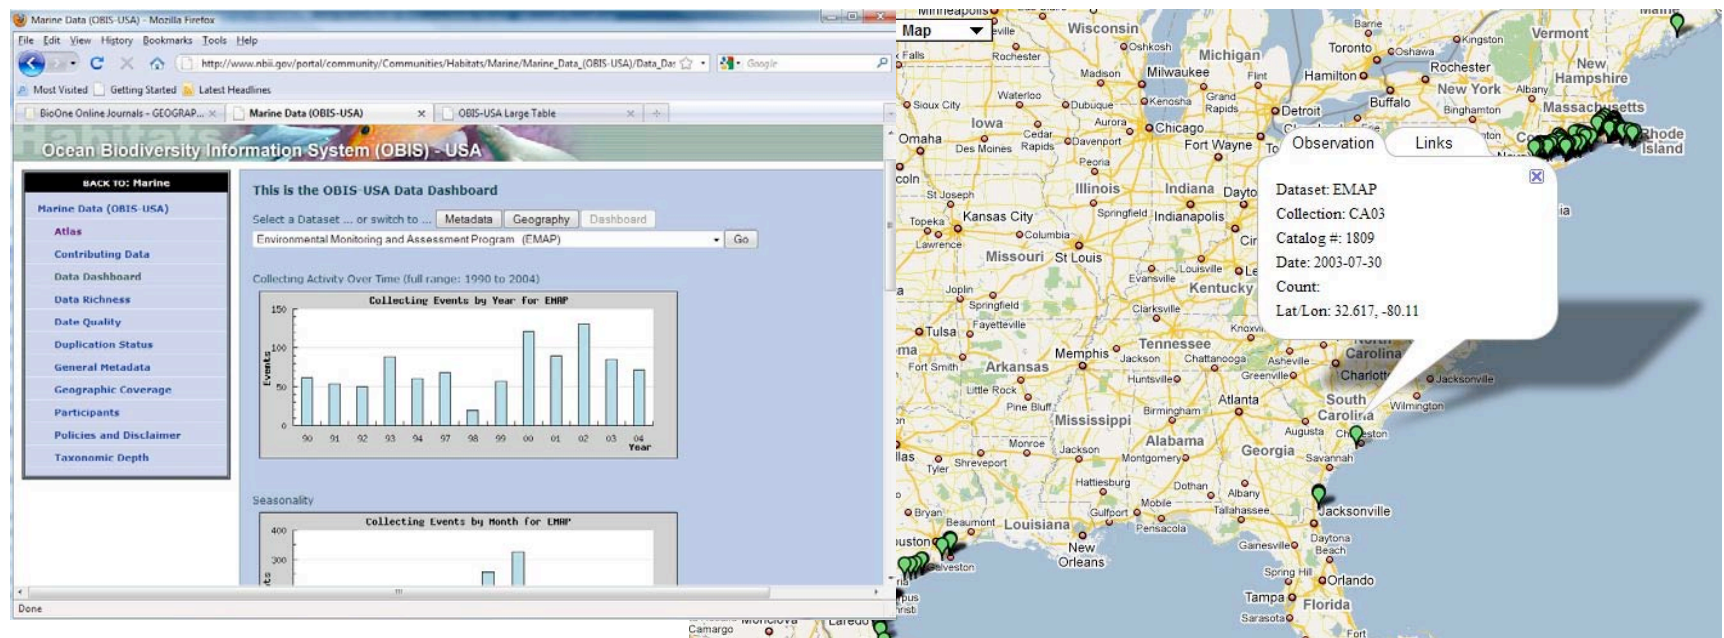

- Open data policy
- Processing made by scientist
- Decentralized data processing & holdings
- Centralize data portals
- Discovering, viewing and downloading facilities
- Additional data and services

A Decade of improvements in Data Systems and Data Sharing

# IOBIS and OBIS-USA

*Ocean information for society:  
sustaining the benefits,  
realizing the potential*

21-25 September 2009, Venice, Italy

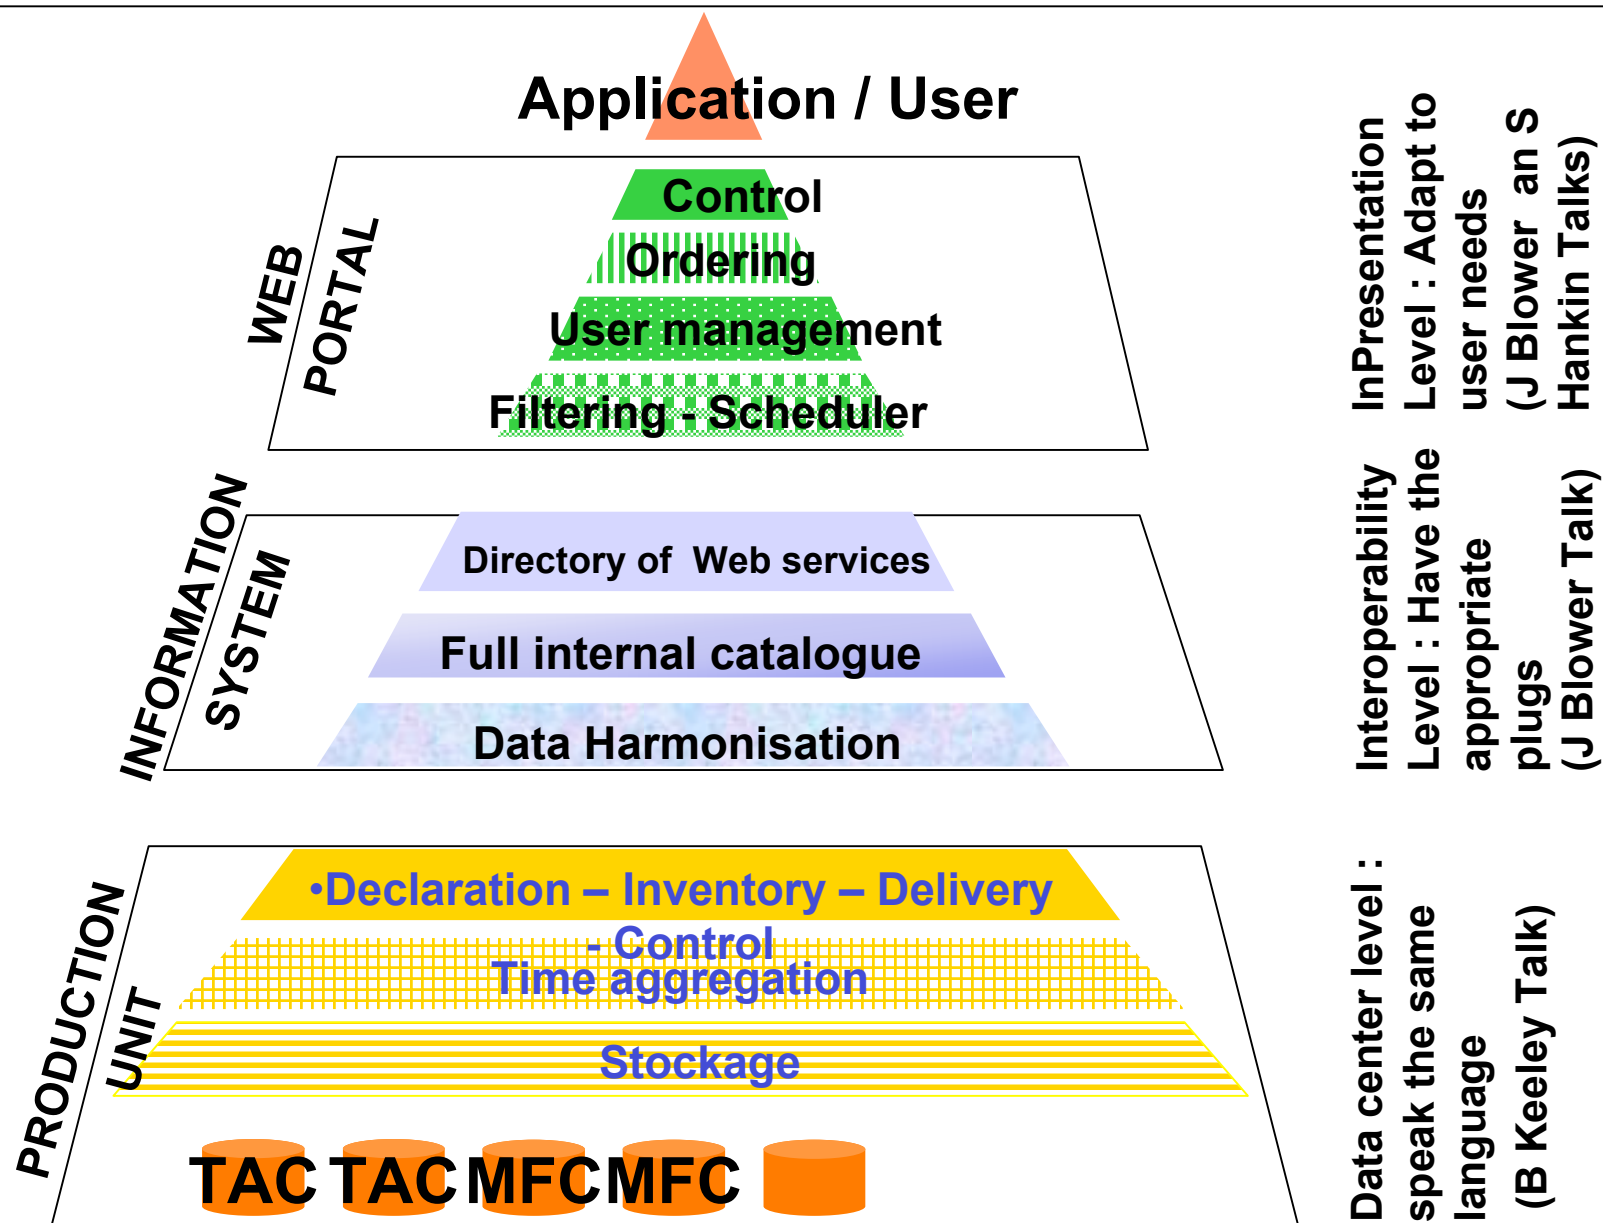

- The Ocean Biogeographic Information System (OBIS) is composed of iOBIS and regional nodes (eg. OBIS-USA).
- iOBIS - 19.3 million records of 106 000 species from 660 distributed databases.
- OBIS-USA - 1.9 million records and 24,112 Taxa (by Scientific Name)  
231,192 Distinct Locations, 40 Datasets  
130 Collections (representing distinct research activities)  
39 Investigators (this includes 'administrative' and 'technical' contacts)  
22 Institutions  
Date range: 1843 – 2008
- iOBIS and OBIS-USA are both growing by leaps and bounds

A Decade of improvements in Data Systems and Data Sharing

# Building a Data Information System: A layered approach

OceanObs'09  
Ocean information for society:  
sustaining the benefits,  
realizing the potential  
21-25 September 2009, Venice, Italy

A Decade of improvements in Data Systems and Data Sharing

# What are the key elements of an efficient Data management network

- Data Format and Metadata

- **We need to agree on a common language**

- ⇒ How can a user know that “subsurface temperature” is called TEMP in ARGO, Temperature in TAO, and is different from Temperature in GHRSSST
- ⇒ This is the purpose of metadata normalization,,

- **We need more than the measurements themselves:**

- ⇒ Metadata that record the context of data acquisition ( sensor, experiment, data centre, PI,...)
- ⇒ Raw data and corrected data to enable future reprocessing
- ⇒ Common Quality flags that characterize the data
- ⇒ History of what has been done on the data , what are the processing steps they have gone through, Calibration information if any.

# What are the key elements of an efficient Data management network

- **Data Quality:** Quality depends on the time you have to “clean the data ”

Can take years !!!!

# Data quality: the cleaner you want the longer it takes!!!!

OceanObs'09  
Ocean information for sustaining the benefits,  
realizing the potential  
21-25 September 2009, Venice, Italy

## It's Fundamental because

⇒ accepting erroneous data can cause erroneous conclusions

⇒ BUT rejecting extreme good data can lead to miss important events ...

- It's a challenge because no « ground truth » really exists
- For forecast data must be delivered with one day.. For reanalysis or climate change studies users request higher quality data set and even corrected data if possible.

⇒ **2 steps: Real time and delayed mode QC**

# What did we prove in past decade

Ocean information for society:  
sustaining the benefits,  
realizing the potential  
21-25 September 2009, Venice, Italy

OceanObs'09

- **Open data policy** is an asset for everybody ( scientists, data managers , policy makers, ...)
- **Information technology and Data management** capabilities are **no more an obstacle** to data access and sharing even in real time
- It's important to **properly archive with the data all the necessary metadata information** for future generations in a common language
- **Building on common vocabularies, formats, distribution means** , even if they are not yet stamped as standards is essential to build a reliable system => **Need to set up mechanism to collaborate with standardization bodies and move to the standards** when stable
- **Feedback from users** is important and **helps improving the quality** of the data

# Conclusions & Next steps for future

- **Accessible:** free access to essential data
- **Comparable** agreement on quality control procedures both in real-time and delayed mode to provide datasets independent of what platform sampled it.
- **Understandable** common standards for data description and distribution. Same syntax and semantic.
- **Recognized/cited** in scientific papers that use them
- **Moving from Observations to information**, use of in-situ/ satellite/ model outputs together to provide services to users

# Yes it's possible

## YES I WILL !
